Revenue Logic & Business Rules

To ensure financial integrity, we use a “Waterfall calculation model. The revenue is recognized only on SUCCESS transactions.

- Merchant Pricing (M): The total fee the school pays.
- Partner Pricing (p): The cost agreed upon with the ERP partner.
- Edviron Buying Price (B): The base cost from the payment Gateway (PG).

The Revenue Formulas:

1. ERP Revenue: M – P (This is what Edviron owes the ERP).
2. Edviron Net Revenue: P – B (This is Edviron’s actual margin).
3. Edviron Gross Revenue: M – B (Total margin kept by Edviron before paying the ERP).
4. Net Settlement to ERP:Transaction Amount + ERP Revenue.

Assumptions Made

- Pricing Format: If a cell contains “%”, it is treated as a percentage of the Transaction Amount. If it is a plain number, it is treated as a Flat Fee in INR.
- Capture status: Transactions marked as SUCCESS but PENDING capture are treated as Recivable Risk- money is authorized but not yet in the nodal account.

Data Transformation (The “Cleaning” Sheet)

Use these formulas in your Excel Cleaned Data sheet or as Power Query custom columns:

A. Normalize Pricing (Convert to INR)

To hadle “2%” vs “15”, use this logic (Excel example for merchant Pricing):

Excel

=IF (ISNUMBER(SEARCH(“%”, J2)), K2 * SUBSTITUTE(J2, “%”, “”)/100, J2)

(Where K2 IS Trans_Amount and J2 is the Merchant Pricing string)

B. Revenue Calculations (DAX or Excel)

Column Name	Formula/Logic
Merchant_INR	Calculated Absolute Merchant Fee
Partner_INR	Calculated Absolute Partner Fee
Buying_INR	Calculated Absolute Buying Fee
